# LSST Science Platform Test Specification

## 1 Introduction

This document specifies the test procedure for the LSST Science Platform. The LSST Science Platform is the component of the LSST system which is responsible for providing data access and data analysis capabilities to users. It is aimed at meeting the needs of several categories of users, including:

- Science users with LSST data rights;
- LSST Project, and later, Operations staff doing algorithm development and the associated validations;
- LSST Project staff engaged in Commissioning and related activities; and
- LSST Operations staff engaged in science validation and other data quality analyses

A full description of this product is provided in LDM-542, with requirements enumerated in LDM-554.

### 1.1 Objectives

This document builds on the description of LSST Data Management's approach to testing as described in LDM-503 to describe the detailed tests that will be performed on the LSST Science Platform as part of the verification of the DM system.

It identifies test cases and procedures for the tests, and the pass/fail criteria for each test.

### 1.2 Scope

This document describes the test procedures for the following components of the LSST system (as described in LDM-542), and their deployment over the resources and services of the LSST Data Facility:

- The science database, especially its Qserv component;
- The API Aspect of the Science Platform, comprising:
  - Catalog query via TAP and related VO services;
  - Image metadata query via TAP and SIAv2;
  - Image retrieval and cutout generation;
  - User Workspace database creation and access; and
  - User Workspace file system access.
- The Portal Aspect of the Science Platform, comprising a set of Web-based tools for:
  - Data discovery for Project-generated and user-generated data;
  - Catalog and image query;
  - Image display;
  - Catalog data visualization;
  - Exploratory data analysis; and
  - Alert subscription control.
- The Notebook Aspect of the Science Platform, comprising:
  - A deployment of the JupyterHub and JupyterLab interactive computing environments;
  - Access to the API Aspect services from within that environment;
  - Direct access to elements of the data systems underlying those services, e.g., access to the User File Workspace as a mounted filesystem rather than through the VOSpace API;
  - A customizable, persistent user environment; and
  - The provision of pre-built deployments of releases of the LSST Stack, usable to configure the computational environment provided by JupyterLab.

## 2 Approach

The major activities to be performed are to:

- Verify that the LSST Science Platform components are capable of performing the functions defined in the relevant DM System Requirements, LSE-61, and in the Science Platform Requirements, LDM-554.
- Ensure that the components of the Science Platform match the documented design.
- Test all the interfaces among components of the Science Platform.
- Test all the interfaces between components of the Science Platform and other DM system components.
- Within the limits of available integration and test hardware platforms and datasets, verify that the Science Platform components meet the performance requirements set forth in the above documents, or extrapolate appropriately from the test systems available to verify that the performance requirements should be met on a fully provisioned hardware platform.
- Repeat these tests when the full hardware platform becomes available.
- Ensure that the test procedures developed are also relevant to pre-deployment testing in the Operations era.
- Ensure that the observed behavior of the Science Platform components when under test is consistent with the available documentation produced by their developers or by other authors.

## 2.1 Tasks and criteria

The following are the major items under test:

- The LSST science database;
- The API Aspect of the Science Platform, encompassing Web APIs for access to LSST Data Products, both within the science database and within the Data Backbone, and enabling the creation, sharing, and management of User Generated Data Products;
- The Portal Aspect of the Science Platform, encompassing user interfaces for data discovery, retrieval, visualization, and exploratory data analysis, as well as an interface for the control of the alert subscription and “mini-broker” filtering mechanism; and
- The Notebook Aspect of the Science Platform, providing interactive computing services for LSST science users and project-internal analysts.

## 2.2 Features to be tested

- Availability and, where relevant, proper interpretation of Prompt Data Products through each Aspect of the Science Platform;
- Availability and, where relevant, proper interpretation of Data Release Data Products through each Aspect of the Science Platform;
- Creation of, access to, and management of User Generated Data Products through each Aspect of the Science Platform;
- Features related to authentication and authorization of users, including those related to custom access controls to User Generated Data Products;
- Features related to the manageability of the Science Platform as an operational service; and
- Integration of the components of the Science Platform with each other and with the underlying services on which they run.

## 2.3 Features not to be tested

This document does not describe facilities for periodically generating or collecting key performance metrics (KPMs), except insofar as those KPMs are incidentally measured as part of executing the documented testcases. The KPMs and the system being used to track KPMs and to ensure compliance with documented requirements are described in LDM-502.

## 2.4 Pass/fail criteria

The results of all tests will be assessed using the criteria described in LDM-503 §4.

Note that, when executing pipelines, tasks or individual algorithms, any unexplained or unexpected errors or warnings appearing in the associated log or on screen output must be described in the documentation for the system under test. Any warning or error for which this is not the case must be filed as a software problem report and filed with the DMCCB.

## 2.5 Suspension criteria and resumption requirements

Refer to individual test cases where applicable.

## 2.6 Naming convention

With the introduction of Jira ATM plugin, the adopted naming convention is based on the corresponding Jira objects:

**LVV** : Is the label for the “LSST Verification and Validation” project in Jira.

**LVV-XXX** : Are Verification Elements, where XXX is the Verification Element identifier. Each Verification Element has at least one Test Case.

**LVV-TYYY** : Are Test Cases. Each Test Case is associated with a Verification Element, where YYY is the Test Case identifier.

A few deprecated test cases are still reporting in the name the old identification, that was according to the pattern LSP-xx-yy where:

**LSP** The product under test: the LSST Science Platform

**xx** Test specification number (in increments of 10)

**yy** Test case number (in increments of 5)

## 4 Test Cases

### 4.1 LVV-T2 - LSP-00-00: Verification of the presence of the expected WISE data

Version	Status	Priority	Verification Type	Owner
1	Deprecated	Normal	Test	Gregory Dubois-Felsmann

#### 4.1.1 Verification Elements

- LVV-9807 - DMS-LSP-REQ-0001-V-01: Access to All Released or Authorized Data Products\_1
- LVV-9809 - DMS-LSP-REQ-0005-V-01: Linkage of Aspects\_1

#### 4.1.2 Test Items

This test will check:

- That the expected tables are present in the database and accessible via the API Aspect and the Portal Aspect;
- That the tables are present with the expected schema as documented in the IPAC- provided WISE documentation;
- That the row counts in the tables are as expected;
- That the tables cover essentially the entire sky, as expected from the characteristics of the WISE mission.

#### Requirements (to be removed when Reqs are synchronized from magic draw)

- DMS-LSP-REQ-0001
- DMS-LSP-REQ-0005

### 4.1.3 Predecessors

None.

### 4.1.4 Environment Needs

**4.1.4.1 Software** The test must, and can only, be carried out on the PDAC instance of the Science Platform. It relies on the availability of the IRSA deployment of the WISE and ALLWISE data to use in order to perform comparisons on content and performance.

The test may be performed from any client computer on the public Internet. The computer used, and the network connection involved, shall be documented in the test report.

The test requires access via the NCSA VPN from the client to the PDAC data services (which means that the performance of the VPN is a contributor to the performance observed).

The client computer must have an up-to-date mainstream Web browser, the identity of which shall be documented in the test report.

The API Aspect tests will be captured in a Jupyter notebook run locally on the client computer, so the client system must have a recent production version of Jupyter installed. (The test does not depend on features of JupyterLab in any way, only the standard Notebook.)

### 4.1.4.2 Hardware

### 4.1.5 Input Specification

The test verifies, and therefore requires, the presence of the following WISE tables on the PDAC systems:

- The Source Catalog table from the AllWISE data release;
- The Multi-Epoch Photometry (MEP) table from the AllWISE data release;
- The Single-exposure Source Database from the WISE All-Sky data release (i.e., from the full-cryo 4-band phase of the original mission);
- The Single-exposure Source Database from the WISE 3-Band Cryo data release (i.e., from the 3-band, inner-cryogen-tank-only phase of the mission);
- The Single-exposure Source Database from the NEOWISE Post-Cryo data release (i.e., from the 2-band warm phase of the mission, pre-hibernation);and

- The Single-exposure Source Database from the NEOWISE Reactivation 2015 data release (i.e., from the first year of the 2-band post-reactivation phase of the mission).

#### 4.1.6 Output Specification

The output will consist of:

- A Jupyter notebook of the API Aspect tests performed;
- A written log of the tests performed on the GUI-based Portal Aspect; and
- A collection of the files that resulted from data download actions performed as part of the tests.

Version	Status	Priority	Verification Type	Owner

### 4.2.1 Verification Elements

- LVV-9808 - DMS-LSP-REQ-0004-V-01: API (Data Access) Aspect\_1

## 4.2.2 Test Items

This test will check that the following low-volume queries can be performed against the WISE catalogs via the API Aspect.

- Small cone searches against the Object-like, ForcedSource-like, and Source-like tables; and
- Searches by exact ID matching against the Object-like, ForcedSource-like, and Source-like tables

The tests will record their performance for comparison against similar queries in the production WISE archive at IRSA, and the returned data will be compared to that for similar queries against the API services provided by IRSA.

#### 4.2.5 Input Specification

The test requires, the presence of the following WISE tables on the PDAC systems:

- The Source Catalog table from the AllWISE data release;
- The Multi-Epoch Photometry (MEP) table from the AllWISE data release;
- The Single-exposure Source Database from the WISE All-Sky data release (i.e., from the full-cryo 4-band phase of the original mission); and
- TheSingle-exposureSourceDatabasefromtheNEOWISEReactivation2015datarelease (i.e., from the first year of the 2-band post-reactivation phase of the mission).

(The 3-band and 2-band Single-exposure Source Database tables from the pre-hibernation mission are not queried in this test case, for the sake of simplicity. These tables are smaller than the two Single-exposure Source Database tables that are included in the test case.)

### 4.3.1 Verification Elements

- LVV-9824 - DMS-LSP-REQ-0028-V-01: Peak Volume for Moderate-Sized Queries\_1
- LVV-9825 - DMS-LSP-REQ-0029-V-01: Peak Volume for Queries on all Objects\_1

### 4.3.2 Test Items

This test exercises a range of table-scan-type queries against the WISE data. Queries shall be performed against the Object-like table, the Forced-Source-like table, and against at least one of the Source-like tables. A range of query result sizes should be exercised, and shall include at least:

- Queries returning a very small amount of data, fewer than 100 rows, and a small subset of columns;
- Queries matching a scaled version of the “low volume” query definition from the Data Access White Paper; and
- Queries matching a scaled version of the “high volume” query definition from the Data Access White Paper.

The scaling of the “low volume” query definition (“50 simultaneous queries against 10 million objects in the catalog, response 10 sec, result data set: 0.1 GB”) is based on a assumption that the “against 10 million objects” is applied against the O(20 billion) rows anticipated in the Object table, and that it contemplates reducing the scope of any non-indexed portion of the WHERE clause of the query to that fraction of one in  $\sim 2000$  of the rows in the table. Scaled to the  $\sim 750$  million rows in the WISE Object-like (AllWISE “Source Catalog”) table, this would be  $\sim 375,000$  rows. Similarly scaling the result set size suggests a result set of  $\sim 3.7$  MB.

Successful completion will be evaluated based on the system’s ability to perform the query at all and to return a result with characteristics corresponding to plausible estimates or extrapolations from scaled-down queries against the IRSA WISE archive. Exact verification may not be realistic because of the lack of a system capable of performing the equivalent queries in the production WISE archive.

At a later date it may be possible to attempt equivalent queries using a non-database system and verify the exact correspondence of results, but the non-database system does not presently exist<sup>1</sup>.

This test will check for the ability, in the Portal Aspect of the LSST Science Platform, to match catalog data with related catalog data. Specifically, the test verifies the ability to navigate from a coadded source catalog entry to the associated forced photometry.

##### Requirements (to be removed when Reqs are synchronized from magic draw)

##### 4.8.4 Environment Needs

###### 4.8.4.1 Software

**4.8.4.2 Hardware** The test must, and can only, be carried out on the PDAC instance of the Science Platform.

The test may be performed from any client computer on the public Internet. The computer used, and the network connection involved, shall be documented in the test report.

The test requires access via the NCSA VPN from the client to the PDAC data services (which means that the performance of the VPN is a contributor to the performance observed).

The client computer must have an up-to-date mainstream Web browser, the identity of which shall be documented in the test report.

#### 4.8.5 Input Specification

The test requires the presence of the following SDSS data, from the Summer 2013 LSST processing, in the PDAC systems:

- The coadded source catalog; and
- The forced photometry catalog driven from the i-band coadded sources.

#### 4.8.6 Output Specification

The output will consist of:

- A written log of the tests performed on the GUI-based Portal Aspect.
